

Log4j Configuration [Configuring within the programming]

Summary

A method to setup the Log4j configuration within the programming.

Description

Configuring within the programming

Example

```
public class EgovLogTest {  
  
    // Receive an instance of Logger class.  
    static Logger logger = Logger.getLogger(EgovLogTest.class);  
  
    public EgovLog() {}  
  
    public static void main(String[] args) {  
  
        /*  
        Simple configuration for log output through the consol,  
        If there is no configuration, notice message is displayed and operation is halted.  
        */  
        BasicConfigurator.configure();  
  
        logger.info ("[INFO] Test log4j.");  
        logger.warn ("[WARN] Test log4j.");  
        logger.debug ("[DEBUG] Test log4j.");  
        logger.error ("[ERROR] Test log4j.");  
        logger.fatal ("[FATAL] Test log4j.");  
        //it is same as loger.log( Level.DEBUG , "debug")  
  
    }  
}
```
