

List

The list created by the e-government mobile standard framework is optimized to the mobile environment. The list width is adjusted to the screen width and the arrow-r icon is applied to the right of the list item. The e-government mobile standard framework supports various types of lists, as the list can carry out various function such as data alignment, navigation (link), result list and data input form.

Base Code

By adding **data-role="listview"** to the list tag (ol, ul), you can create the lists provided by the e-government mobile standard framework. In order to insert a list suit to the page layout, add **data-inset="true"** to the list tag. When data-inset is set to true, margin and rounded edges are applied to the list.

```
List Item 1  
List Item 2  
List Item 3  
<ul data-role="listview" data-inset="true">  
  <li>List Item 1</li>  
  <li>List Item 2</li>  
  <li>List Item 3</li>  
</ul>
```

List Link

By adding **Anchor link** to tag, you can create a list link that carries out the navigation.

- [Link to Home](#)
- [Link to egovframe](#)

```
<ul data-role="listview" data-inset="true">  
  <li><a href="/mguide/guide/guide.do">Link to Home</a></li>  
  <li><a href="http://www.egovframe.go.kr">Link to egovFrame</a></li>  
</ul>
```

List of expanded functions

- [Nested List](#)
- [Numbered List](#)
- [Split Button](#)
- [List Divider](#)
- [Count Bubble](#)
- [Thumbnail](#)
- [List Icon](#)
- [Content Formatting](#)
- [Search Filter Bar](#)

List update

You can use the **refresh()** method to update the list style and contents dynamically.

[refresh](#)

Please press refresh button.

```
$('#findList').listview('refresh');
```
